

# Executive Summary Dashboard

*From Opinion to Evidence: A Purpose-Built AI Decision-Support Workflow for BH Consultants*

## Core Thesis:

*“The agent strengthens the evidence; the consultant owns the decision.” Every material number is explicitly labeled as a verified fact, internal input, assumption, or modeled estimate.*

## The Strategic Shift

| Metric / Dimension |  The Current Process (Today) |  The AI-Assisted Workflow (Tomorrow)        |
|--------------------|---------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Evidence Gathering | Assumptions built from fragmented project info, personal experiences, and manual research.                    | <b>Automated Retrieval Layer:</b><br>Instantly combines BH internal project history with validated external research.         |
| Case Comparisons   | Manual search, relying on a few known or subjective precedents.                                               | <b>True Comparability:</b> Algorithms systematically filter and align genuinely comparable historical cases.                  |
| Output Type        | Static point-estimate predictions or a single “magic number”.                                                 | <b>Dynamic Scenario Packages:</b><br>Transparent ranges, clear sensitivities, and explicit uncertainty boundaries.            |
| Human Control      | High data assembly friction; manual and unstructured evidence trails.                                         | <b>Human Gate:</b> 100% review-based framework. No automated recommendation or approval occurs without consultant validation. |

## How the 4-Step Workflow Works

01. Baseline Present → 02. Stress-Test Future → 03. Produce Scenarios → 04. Validate Gates

- **01 • Baseline the Present:** Audit current land use/density, access and network capacity, trip origins/destinations, baseline mode splits, walk/PT catchments, and immediate constraints.
- **02 • Stress-Test the Future:** Dynamically vary explicit core drivers including population/jobs, land-use phasing, future transport supply, policy/parking adjustments, and technological adoption.
- **03 • Produce Scenarios:** Generate bounded outcomes including *Conservative* (slower adoption, higher friction), *Base Case* (most likely planning metrics), and *Upside* (accelerated adoption, enabling factors).
- **04 • Validate Before Use:** Final verification gates checking structured citations, source freshness timestamps, comparative logic alignments, and remaining open evidence gaps.

## Illustrative PAYG Cost Model

**Baseline Simulation: 100 Employees × 3 Questions/Day × 22 Working Days = 6,600 Queries/Month**

[ Tier A: Simple Generative Answer ] .....  ~\$132 / month  
(~\$1.32 per employee)

[ Tier B: Answer + 1 Agent Action ] .....  ~\$462 / month (~\$4.62  
per employee)

[ Tier C: Tenant Graph Grounding ] .....  ~\$792 / month (~\$7.92  
per employee)

 *Scaling usage to 5 questions/day increases the respective tier totals to \$220 / \$770 / \$1,320 per month. Under standalone Copilot Studio PAYG, end-users do not automatically require an additional \$30/user M365 Copilot license unless broader Office app productivity is needed.*

## Proof of Concept: Pilot Framework

---

To establish clear commercial and delivery proof, the framework mandates running a pilot comparing **20–30 real consultant questions** evaluated concurrently with and without the AI workflow asset.

- **Research Efficiency:** Measured by the reduction in total hours to assemble the first actionable evidence pack.
- **Data Integrity:** Evaluated via the exact percentage of core project claims backed by traceable, time-stamped sources.
- **Risk Mitigation:** Measured by the total number of unsupported or directly conflicting data claims caught prior to client presentation.
- **Reusability Rate:** Tracked by the percentage of independent teams and project groups successfully adopting the standardized workflow.

---

This document is prepared for internal BH decision support concepts. All figures, licensing structures, and pricing models reflect illustrative enterprise scenarios and current list configurations which must be validated prior to procurement.
